

# STEPPER MOTOR CONTROLLER IC

Check for Samples: DRV8825

### **FEATURES**

- PWM Microstepping Motor Driver
  - Built-In Microstepping Indexer
  - Five-Bit Winding Current Control Allows Up to 32 Current Levels
  - Low MOSFET On-Resistance
- 2.5-A Maximum Drive Current at 24 V. 25°C
- Built-In 3.3-V Reference Output
- 8-V to 45-V Operating Supply Voltage Range
- Thermally Enhanced Surface Mount Package

### **APPLICATIONS**

- Automatic Teller Machines
- Money Handling Machines
- Video Security Cameras
- Printers
- Scanners
- Office Automation Machines
- Gaming Machines
- Factory Automation
- Robotics

## **DESCRIPTION**

The DRV8825 provides an integrated motor driver solution for printers, scanners, and other automated equipment applications. The device has two H-bridge drivers, and can drive a bipolar stepper motor or two DC motors. The output driver block for each consists of N-channel power MOSFET's configured as full H-bridges to drive the motor windings. The DRV8825 can supply up to 2.5-A peak or 1.75-A RMS output current (with proper heatsinking at 24 V and 25°C).

A simple step/direction interface allows easy interfacing to controller circuits. Pins allow configuration of the motor in full-step up to 1/32-step modes. Decay mode is programmable.

Internal shutdown functions are provided for overcurrent protection, short circuit protection, undervoltage lockout and overtemperature.

The DRV8825 is available in a 28-pin HTSSOP package with PowerPAD™ (Eco-friendly: RoHS & no Sb/Br).

# **Table 1. TERMINAL FUNCTIONS**

NAME	PIN	I/O <sup>(1)</sup>	DESCRIPTION	EXTERNAL COMPONENTS OR CONNECTIONS		
POWER AND	GROUND					
GND	14, 28	-	Device ground			
VMA	4	-	Bridge A power supply	Connect to motor supply (8 - 45 V). Both pins		
VMB	11	-	Bridge B power supply	must be connected to same supply.		
V3P3OUT	15	0	3.3-V regulator output	Bypass to GND with a 0.47- $\mu$ F 6.3-V ceramic capacitor. Can be used to supply VREF.		
CP1	1	Ю	Charge pump flying capacitor	Connect a 0.01-μF 50-V capacitor between		
CP2	2	Ю	Charge pump flying capacitor	CP1 and CP2.		
VCP	3	Ю	High-side gate drive voltage	Connect a 0.1- $\mu$ F 16-V ceramic capacitor to VM.		
CONTROL						
nENBL	21	I	Enable input	Logic high to disable device outputs and indexer operation, logic low to enable		
nSLEEP	17	I	Sleep mode input	Logic high to enable device, logic low to enter low-power sleep mode		
STEP	22	I	Step input	Rising edge causes the indexer to move one step		
DIR	20	I	Direction input	Level sets the direction of stepping		
MODE0	24	I	Microstep mode 0			
MODE1	25	I	Microstep mode 1	MODE0 - MODE2 set the step mode - full, 1/2, 1/4, 1/8/ 1/16, or 1/32 step		
MODE2	26	I	Microstep mode 2	72, 77, Web 1716, 61 Web etcp		
DECAY	19	I	Decay mode	Low = slow decay, open = mixed decay, high = fast decay		
nRESET	16	I	Reset input	Active-low reset input initializes the indexer logic and disables the H-bridge outputs		
AVREF	12	I	Bridge A current set reference input	Reference voltage for winding current set.		
BVREF	13	I	Bridge B current set reference input	Normally AVREF and BVREF are connected to the same voltage. Can be connected to V3P3OUT.		
STATUS						
nHOME	27	OD	Home position	Logic low when at home state of step table		
nFAULT	18	OD	Fault	Logic low when in fault condition (overtemp, overcurrent)		
OUTPUT			•	•		
ISENA	6	Ю	Bridge A ground / Isense	Connect to current sense resistor for bridge A.		
ISENB	9	Ю	Bridge B ground / Isense	Connect to current sense resistor for bridge B.		
AOUT1	5	0	Bridge A output 1	Connect to bipolar stepper motor winding A.		
AOUT2	7	0	Bridge A output 2	Positive current is AOUT1 → AOUT2		
BOUT1	10	0	Bridge B output 1	Connect to bipolar stepper motor winding B.		
BOUT2 8 O			Bridge B output 2	Positive current is BOUT1 → BOUT2

### **ABSOLUTE MAXIMUM RATINGS**

over operating free-air temperature range (unless otherwise noted) (1) (2)

			VALUE	UNIT	
VMx	Power supply voltage range		-0.3 to 47	V	
	Digital pin voltage range		–0.5 to 7	V	
VREF	Input voltage		-0.3 to 4	V	
	ISENSEx pin voltage		-0.3 to 0.8	V	
	Peak motor drive output current, t < 1 μS	Internally limited	А		
	Continuous motor drive output current <sup>(3)</sup>		2.5	А	
	CCD actions	HBD (human body model)	2000		
	ESD rating	CDM (charged device model)	500	V	
	Continuous total power dissipation		See Dissipation Ratings table		
TJ	Operating virtual junction temperature range		-40 to 150	°C	
T <sub>A</sub>	Operating ambient temperature range		-40 to 85	°C	
T <sub>stg</sub>	Storage temperature range		-60 to 150	°C	

- (1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground terminal.
- (3) Power dissipation and thermal limits must be observed.

### **FUNCTIONAL DESCRIPTION**

### **PWM Motor Drivers**

The DRV8825 contains two H-bridge motor drivers with current-control PWM circuitry. A block diagram of the motor control circuitry is shown in Figure 2.

**Figure 2. Motor Control Circuitry** 

Note that there are multiple VM motor power supply pins. All VM pins must be connected together to the motor supply voltage.

## **Current Regulation**

The current through the motor windings is regulated by a fixed-frequency PWM current regulation, or current chopping. When an H-bridge is enabled, current rises through the winding at a rate dependent on the DC voltage and inductance of the winding. Once the current hits the current chopping threshold, the bridge disables the current until the beginning of the next PWM cycle.

In stepping motors, current regulation is used to vary the current in the two windings in a semi-sinusoidal fashion to provide smooth motion.

The PWM chopping current is set by a comparator which compares the voltage across a current sense resistor connected to the xISEN pins, multiplied by a factor of 5, with a reference voltage. The reference voltage is input from the xVREF pins.

The full-scale (100%) chopping current is calculated in Equation 1.

$$I_{CHOP} = \frac{V_{REFX}}{5 \cdot R_{ISENSE}} \tag{1}$$

#### Example:

If a  $0.25-\Omega$  sense resistor is used and the VREFx pin is 2.5 V, the full-scale (100%) chopping current will be 2.5 V / (5 x 0.25  $\Omega$ ) = 2 A.

The reference voltage is scaled by an internal DAC that allows fractional stepping of a bipolar stepper motor, as described in the microstepping indexer section below.

### **Decay Mode**

During PWM current chopping, the H-bridge is enabled to drive current through the motor winding until the PWM current chopping threshold is reached. This is shown in Figure 3 as case 1. The current flow direction shown indicates positive current flow.

Once the chopping current threshold is reached, the H-bridge can operate in two different states, fast decay or slow decay.

In fast decay mode, once the PWM chopping current level has been reached, the H-bridge reverses state to allow winding current to flow in a reverse direction. As the winding current approaches zero, the bridge is disabled to prevent any reverse current flow. Fast decay mode is shown in Figure 3 as case 2.

In slow decay mode, winding current is re-circulated by enabling both of the low-side FETs in the bridge. This is shown in Figure 3 as case 3.

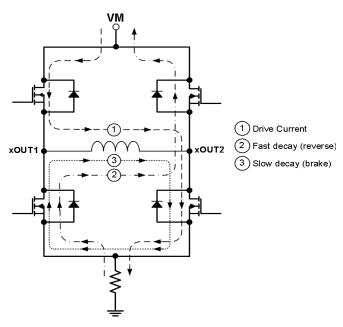

Figure 3. Decay Mode

The DRV8825 supports fast decay, slow decay and a mixed decay mode. Slow, fast, or mixed decay mode is selected by the state of the DECAY pin - logic low selects slow decay, open selects mixed decay operation, and logic high sets fast decay mode.

Mixed decay mode begins as fast decay, but at a fixed period of time (75% of the PWM cycle) switches to slow decay mode for the remainder of the fixed PWM period. This occurs only if the current through the winding is decreasing (per the indexer step table); if the current is increasing, then slow decay is used.

## **Blanking Time**

After the current is enabled in an H-bridge, the voltage on the xISEN pin is ignored for a fixed period of time before enabling the current sense circuitry. This blanking time is fixed at  $3.75~\mu s$ . Note that the blanking time also sets the minimum on time of the PWM.

# **Microstepping Indexer**

Built-in indexer logic in the DRV8825 allows a number of different stepping configurations. The MODE0 - MODE2 pins are used to configure the stepping format as shown in Table 2.

MODE2 MODE0 STEP MODE MODE1 0 0 0 Full step (2-phase excitation) with 71% current 0 0 1 1/2 step (1-2 phase excitation) 0 0 1 1/4 step (W1-2 phase excitation) 8 microsteps / step 0 1 1 1 0 0 16 microsteps / step 0 1 32 microsteps / step 1 1 1 0 32 microsteps / step 1 1 1 32 microsteps / step

**Table 2. Stepping Format** 

Table 3 shows the relative current and step directions for different settings of MODEx. At each rising edge of the STEP input, the indexer travels to the next state in the table. The direction is shown with the DIR pin high; if the DIR pin is low the sequence is reversed. Positive current is defined as xOUT1 = positive with respect to xOUT2.

Note that if the step mode is changed while stepping, the indexer will advance to the next valid state for the new MODEx setting at the rising edge of STEP.

The home state is 45°. This state is entered at power-up or application of nRESET. This is shown in Table 3 by the shaded cells.

### nRESET, nENBLE and nSLEEP Operation

The nRESET pin, when driven active low, resets internal logic, and resets the step table to the home position. It also disables the H-bridge drivers. The STEP input is ignored while nRESET is active.

The nENBL pin is used to control the output drivers and enable/disable operation of the indexer. When nENBL is low, the output H-bridges are enabled, and rising edges on the STEP pin are recognized. When nENBL is high, the H-bridges are disabled, the outputs are in a high-impedance state, and the STEP input is ignored.

Driving nSLEEP low will put the device into a low power sleep state. In this state, the H-bridges are disabled, the gate drive charge pump is stopped, the V3P3OUT regulator is disabled, and all internal clocks are stopped. In this state all inputs are ignored until nSLEEP returns inactive high. When returning from sleep mode, some time (approximately 1 ms) needs to pass before applying a STEP input, to allow the internal circuitry to stabilize.

### **Protection Circuits**

The DRV8825 is fully protected against undervoltage, overcurrent and overtemperature events.

### **Overcurrent Protection (OCP)**

An analog current limit circuit on each FET limits the current through the FET by removing the gate drive. If this analog current limit persists for longer than the OCP time, all FETs in the H-bridge will be disabled and the nFAULT pin will be driven low. The device will remain disabled until either nRESET pin is applied, or VM is removed and re-applied.

Overcurrent conditions on both high and low side devices; i.e., a short to ground, supply, or across the motor winding will all result in an overcurrent shutdown. Note that overcurrent protection does not use the current sense circuitry used for PWM current control, and is independent of the  $I_{SENSE}$  resistor value or VREF voltage.

### Thermal Shutdown (TSD)

If the die temperature exceeds safe limits, all FETs in the H-bridge will be disabled and the nFAULT pin will be driven low. Once the die temperature has fallen to a safe level operation will automatically resume.

# **Undervoltage Lockout (UVLO)**

If at any time the voltage on the VM pins falls below the undervoltage lockout threshold voltage, all circuitry in the device will be disabled and internal logic will be reset. Operation will resume when  $V_{\rm M}$  rises above the UVLO threshold.

#### THERMAL INFORMATION

### **Thermal Protection**

The DRV8825 has thermal shutdown (TSD) as described above. If the die temperature exceeds approximately 150°C, the device will be disabled until the temperature drops to a safe level.

Any tendency of the device to enter TSD is an indication of either excessive power dissipation, insufficient heatsinking, or too high an ambient temperature.

### **Power Dissipation**

Power dissipation in the DRV8825 is dominated by the power dissipated in the output FET resistance, or R<sub>DS(ON)</sub>. Average power dissipation when running a stepper motor can be roughly estimated by Equation 2.

$$P_{TOT} = 4 \cdot R_{DS(ON)} \cdot (I_{OUT(RMS)})^2$$
(2)

where  $P_{TOT}$  is the total power dissipation,  $R_{DS(ON)}$  is the resistance of each FET, and  $I_{OUT(RMS)}$  is the RMS output current being applied to each winding.  $I_{OUT(RMS)}$  is equal to the approximately 0.7x the full-scale output current setting. The factor of 4 comes from the fact that there are two motor windings, and at any instant two FETs are conducting winding current for each winding (one high-side and one low-side).

The maximum amount of power that can be dissipated in the device is dependent on ambient temperature and heatsinking.

Note that  $R_{DS(ON)}$  increases with temperature, so as the device heats, the power dissipation increases. This must be taken into consideration when sizing the heatsink.

### Heatsinking

The PowerPAD™ package uses an exposed pad to remove heat from the device. For proper operation, this pad must be thermally connected to copper on the PCB to dissipate heat. On a multi-layer PCB with a ground plane, this can be accomplished by adding a number of vias to connect the thermal pad to the ground plane. On PCBs without internal planes, copper area can be added on either side of the PCB to dissipate heat. If the copper area is on the opposite side of the PCB from the device, thermal vias are used to transfer the heat between top and bottom layers.

For details about how to design the PCB, refer to TI application report SLMA002, " PowerPAD™ Thermally Enhanced Package" and TI application brief SLMA004, " PowerPAD™ Made Easy", available at www.ti.com.

In general, the more copper area that can be provided, the more power can be dissipated. It can be seen that the heatsink effectiveness increases rapidly to about 20 cm<sup>2</sup>, then levels off somewhat for larger areas.

#### IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
